COMMENTS:

After a Form 17 Bradenhead Test (Doc #403449707), the FRU 297-28A5 (API: 05-103-10690) has been identified as having Continuous Flow on the bradenhead and intermediate strings after the 30-minute blowdown test. The bradenhead test shows an initial shut-in bradenhead pressure of 850 psi with 600 psi at the expiration of the 30-minute blowdown. The intermediate test shows an initial shut-in pressure of 600 psi with 450 psi at the expiration of the 30-minute blowdown. During both blowdown tests, the production casing dropped indicating flow between all three casing strings. The production casing pressure shows an initial shut-in pressure of 875 psi with 782 psi at the expiration of the 30-minute BH test. During the intermediate test, the production casing shows an initial shut-in pressure of 782 psi with 527 psi at the expiration of the 30-minute intermediate test. Caerus plans to perform a Plug & Abandonment during its 2024 P&A program for the FRU 297-28A5. This well has historically not produced, and the surface casing is believed to be have integrity due to its ability to successfully hold pressure. The FRU 297-28A5 falls in the Mule Deer Winter Concentration Area, therefore, Caerus plans and requests to implement the P&A in April/May 2024 (depending on weather condition and access) to adhere to the CPW regulation. The rig will pull the tubing hanger, set a bridge plug to isolate the producing interval, and perform additional pressure testing with tubing and a packer to confirm the presence of a casing leak. Caerus will assess the results of the testing to determine the most effective and safe plugging strategy for this wellbore.
