Dear Mr. Peterson:

Below please find a copy of the above referenced Site Assessment Report (Report) for the Petrikin A34-08 Facility (Site) located in Weld County, Colorado. The text below describes decommissioning, assessment, and associated soil sampling conducted by Tasman, Inc. (Tasman) and WSP Global, Inc. (WSP), on behalf of Noble Energy, Inc. (Noble) between March 3, 2022, and February 28, 2023.

Introduction

This document describes the results of soil sampling activities conducted at the Site to evaluate potential subsurface impacts. The activities described below were performed in response to the discovery of impacted material during decommissioning activities conducted at the Site.

Site Background

The Site is located approximately 4.4 miles north-northeast of Kersey in Weld County, Colorado. The Site legal description is the northeast quarter of the southeast quarter of Section 34, Township 6 North, Range 64 West, 6th Principal Meridian. The Site is on terrain that slopes gradually to the east at latitude 40.446231° and longitude -104.529526° [North American Datum of 1983(NAD83)] and is located approximately 0.14 miles west of the intersection of County Road 57 and County Road 62¾ (Figure 1).

Tasman was initially retained by Noble on March 3, 2022, to complete soil sampling and documentation during Site decommissioning and abandonment activities at the facility. As reported in the initial Form 19, historical impacts were confirmed on March 14, 2022. The Form 19 was submitted to the Energy and Carbon Management Commission (ECMC) on March 15, 2022. The ECMC subsequently issued Spill/Release Point ID Number 481756 for this event. The ECMC assigned Remediation Number 20470 for the project.

Site Decommissioning Activities

On March 3, 2022, Tasman completed decommissioning soil sampling and documentation for the Petrikin A34-08 Facility. Soil samples were collected throughout the Site targeting the following different areas and pieces of production equipment:

Area of Site	Sampling	Sample description
Aboveground storage tank (AST)	AST01@0.5'	Surface soil sample below former tank location.
Horizontal separator	SEP01-DL01@3'	Soil sample beneath separator dump line riser.
Meter house	MH01@0.5'	Surface sample beneath aboveground run of meter piping.
Partially buried produced water vault (PWV)	SS01@2.5' through SS04@2.5', and FS01@5'	Four sidewall samples and one excavation floor sample.

All soil samples collected were field screened for volatile organic compounds (VOC) using a photoionization detector (PID) and standard headspace sampling techniques. Seven soil samples collected during decommissioning activities were submitted to Summit Scientific (Summit) in Golden, Colorado for laboratory analysis of the ECMC Table 915-1 list of organic compounds in soil using United States Environmental Protection Agency (USEPA) Method 8260B and USEPA Method 8270D, and total petroleum hydrocarbons (TPH) using USEPA Methods 8260B and 8015D. The samples were also submitted for laboratory analysis of pH, electrical conductivity (EC), sodium adsorption ratio (SAR) using USEPA saturated paste extraction method, and boron using the hot water-soluble soil extract method. Soil sample FS01@5' was also submitted to Summit for laboratory analysis of ECMC Table 915-1 metals in soil using USEPA Method 6020B. Groundwater was not encountered during decommissioning activities at the Facility. Facility decommissioning soil analytical results are summarized in Table 1 and the laboratory results from soil samples SS01@2.5', and FS01@5' illustrated on Figure 2. The Facility decommissioning soil laboratory analytical reports are included in Attachment A.

Site Assessment Activities

On March 28, 2022, WSP conducted an initial site assessment to delineate subsurface soil impacts identified during Site decommissioning. WSP advanced boring FS01 to 14 feet below ground surface (ft bgs) in the area of decommissioning sample FS01@5'. WSP advanced four additional borings, FS02 through FS05, to 6.5 ft bgs and laterally bounding decommissioning sample FS01@5'. Concurrently with the soil borings, WSP collected one background sample east of the Site to assess background native soil conditions. The soil borings were advanced using a Geoprobe via direct push, and during soil boring operations, soil samples were collected, and field screened for VOCs using a PID and standard headspace sampling techniques. The following soil samples were collected by WSP during the initial site assessment:

All Site Assessment Soil Boring soil samples were submitted to Origins Laboratory, Inc. (Origins) in Denver, Colorado for laboratory analysis of the ECMC Table 915-1 list of organic compounds in soil using USEPA Methods 8260B and 8270D, and TPH using USEPA Methods 8260B and 8015D, as well as analysis of pH, EC, SAR using USEPA saturated paste extraction method, and boron using the hot water-soluble soil extract method. Soil samples FS01@6.5' and FS01@12' were also submitted to Origins for analysis of ECMC Table 915-1 metals in soil using USEPA Method 6020B. Background soil sample, BG01@6.5', was submitted to Origins for laboratory analysis of pH and SAR using USEPA saturated paste extraction method, as well as analysis of arsenic using USEPA Method 6020B. Soil sample results from the initial site assessment conducted by WSP are summarized in Table 1 and illustrated on Figure 3. Laboratory analytical reports are included in Attachment A and the boring logs are included in Attachment B.

Although WSP did not encounter groundwater while advancing soil borings during initial site assessment activities, soil boring FS01 was converted to a temporary groundwater monitoring well set at 14 ft bgs. At the conclusion of the initial site assessment all other borings advanced by WSP were backfilled with bentonite. After installation of temporary monitoring well FS01, gauging of groundwater levels using an interface probe confirmed the lack of a shallow groundwater table present at the Site, and the monitoring well was subsequently removed and backfilled with bentonite.

On February 27-28, 2023, Tasman returned to the site to further delineate potential subsurface soil impacts identified during Site decommissioning. Tasman advanced six borings (BH01-BH06) to depths ranging from 12-14 ft bgs at the Site using a hand auger and an AMS Power Probe via direct push. In addition, Tasman used a hand auger to advance and collect ten background samples from five borehole locations southeast of the Site to further assess background native soil conditions. During soil boring operations, soil samples were collected and field screened for VOCs using a PID and standard headspace sampling techniques. The following soil samples were collected at depths corresponding to initial observed impacts, where elevated PID readings were observed, and/or terminal depth of the borings:

While advancing soil boring BH04 a terminal depth sample was unable to be collected due to the drill rods breaking and obstructing recovery from 12-14 ft bgs. All eight site assessment soil samples, shown above, were submitted to Summit for laboratory analysis of the ECMC Table 915-1 list of organic compounds in soil using USEPA Methods 8260B and 8270D, and TPH using USEPA Methods 8260B and 8015D. Additionally, the soil boring samples were submitted for analysis of ECMC Table 915-1 metals in soil using USEPA Method 6020B as well as analysis of pH, EC, SAR using USEPA saturated paste extraction method, and boron using the hot water-soluble soil extract method. The 10 background samples, shown above, were submitted to Summit for laboratory analysis of arsenic, barium, lead, and selenium in soil using USEPA Method 6020B as well as analysis of SAR using USEPA saturated paste extraction method. Site assessment and background soil sample analytical results are summarized in Table 1 and illustrated on Figure 3. Laboratory analytical reports are included in Attachment A and the boring logs are included in Attachment B.

Groundwater was not encountered during the site assessment conducted by Tasman. At the conclusion of the site assessment, boreholes BH01 through BH06 were backfilled with bentonite.

Results

Laboratory analytical results indicate hydrocarbon concentrations above ECMC Table 915-1 Protection of Groundwater Soil Screening Levels (GSSLs) in decommissioning soil samples SS01@2.5' and FS01@5', and in WSP initial site assessment soil sample FS01@6.5'. Hydrocarbon compounds detected above ECMC Table 915-1 GSSLs included a combination of 1,2,4-trimethylbenzene (1,2,4-TMB), 1,3,5-trimethylbenzene (1,3,5-TMB), naphthalene, 1-methylnaphthalene (1-M), and 2-methylnaphthalene (2-M). Hydrocarbon compounds were not detected above laboratory reporting limits in any of the other five initial site assessment soil samples collected by WSP, or in any of the eight soil samples collected during the site assessment conducted by Tasman. Elevated concentrations of metals above applicable ECMC Table 915-1 GSSLs were observed in all analyzed soil samples and consisted of a combination of arsenic, and selenium. In addition, barium was detected above ECMC Table 915-1 GSSLs in soil sample FS01@5' and lead was detected above ECMC Table 915-1 GSSLs in soil sample BH06@10-12'. Laboratory analytical results indicate pH is above ECMC Table 915-1 Soil Suitability for Reclamation (SSR) standards in four of the 22 analyzed soil samples, but all detections are within 0.5 the upper ECMC Table 915-1 SSR standard which is consistent with natural variability of pH in the region. Laboratory analytical results indicate SAR is in exceedance of ECMC Table 915-1 SSR standards in five of the 22 analyzed soil samples at the site.

A total of eleven background samples were collected from six discrete locations and analyzed for arsenic, barium, lead, selenium, and SAR. The average background concentrations of arsenic, barium, lead, and selenium with a 1.25 multiplier applied were calculated to be 8.02 milligrams per kilogram (mg/kg), 27.2 mg/kg, 12.3 mg/kg, and 1.53 mg/kg, respectively. The average release area concentrations of arsenic, barium, lead, and selenium were calculated to be 6.14 mg/kg, 32.0 mg/kg, 10.3 mg/kg, and 1.14 mg/kg, respectively. Average background concentrations for arsenic, lead, and selenium were all calculated to be higher than their average concentrations in the soil boring samples. As such, arsenic, lead, and selenium should not be considered contaminants of concern at the Site.

The average background concentration for SAR was calculated to be 5.33, whereas the average release area concentration of SAR was calculated to be 4.48. Since the average background concentration for

SAR is higher than the average release area concentration for SAR, SAR should not be considered a contaminant of concern at the Site.

Since groundwater was not encountered at the Site within 14-ft of the ground surface, a desktop review of Colorado's Division of Water Resources (DWR) Well Permit Research Mapper was performed to determine the depth to water below ground surface (BGS) in permitted water wells within a 0.5-mile radius of the spill location. Refer to Figure 4 for a visual representation of the results of this inquiry. One permitted water well was identified within the 0.5-mile radius, and according to the permit records, the static groundwater level in the well is 75 ft bgs. Since the static groundwater level is 75 ft bgs in the region of the Site, and since organic compounds in soil and metals exceedances above ECMC Table 915-1 GSSLs or established background levels were limited to depths shallower than 6.5 ft bgs, there is no evidence to suggest that organic compounds or metals will migrate vertically to reach the groundwater table at the Site. As such, Noble proposes to utilize ECMC Table 915-1 Residential Soil Screening Levels (RSSLs). Applying ECMC Table 915-1 RSSLs to the Site eliminates the naphthalene, 1-M, and 2-M, as well as the detected metals as contaminants of concern, with the exception of arsenic. While concentrations of arsenic are still above ECMC Table 915-1 RSSLs, the average arsenic concentrations in the soil boring samples are within the established background concentrations at the Site.

Conclusions

Hydrocarbon impacts observed during facility decommissioning and the initial site assessment have been successfully delineated vertically and laterally. Hydrocarbon compounds were not detected above ECMC Table 915-1 RSSLs in any decommissioning or site assessment soil samples. Since there is no evidence to suggest a pathway for contaminant migration to the groundwater table, Noble proposes to utilize ECMC Table 915-1 Residential Soil Screening Levels (RSSLs) when evaluating the decommissioning and site assessment soil sampling results.

Since all organic compounds, inorganic compounds, and metals in soil are either below ECMC Table 915-1 RSSLs or established background levels, and since the pH exceedances observed are within natural variability in the region, Noble is requesting a No Further Action (NFA) designation for the Site from the ECMC.

Remarks

The discussion and conclusions contained in this report represent the professional opinions of Tasman, Inc. These opinions are based on currently available information and are arrived at in accordance with currently accepted geologic and engineering practices.

Attached are your analytical results for Noble - Petrikin A34-08 received by Origins Laboratory, Inc. March 28, 2022. This project is associated with Origins project number Y203733-01.

The analytical results in the following report were analyzed under the guidelines of EPA Methods. These methods are identified as follows; "SW" are defined in SW-846, "EPA" are defined in 40CFR part 136 and "SM" are defined in the most current revision of Standard Methods For the Examination of Water and Wastewater.

The analytical results apply specifically to the samples and analyses specified per the attached Chain of Custody. As such, this report shall not be reproduced except in full, without the written approval of Origin's laboratory.

Unless otherwise noted, the analytical results for all soil samples are reported on a wet weight basis. All analytical analyses were performed under NELAP guidelines unless noted by a data qualifier.

Any holding time exceedances, deviations from the method specifications or deviations from Origins Laboratory's Standard Operating Procedures are outlined in the case narrative.

Thank you for selecting Origins for your analytical needs. Please contact us with any questions concerning this report, or if we can help with anything at all.

Notes and Definitions

U Sample is Non-Detect.

QR-DUP RPD exceeds QC acceptance criteria, this indicates source sample is not homogenous.

QM-07 The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

J Estimated Value. Analyte below reported quantitation limit.

* QC Failure

ND Analyte NOT DETECTED at or above the reporting limit

RPD Relative Percent Difference

All soil results are reported on a wet weight basis.

Origins Laboratory, Inc.

Notes and Definitions

RPD-1	The RPD failure for the sample duplicate analysis is most likely due to a non-homogeneous sample matrix.
QM-06	Due to noted non-homogeneity of the QC sample matrix, the MS/MSD did not provide reliable results for accuracy and precision. Sample results for the QC batch were accepted based on LCS/LCSD percent recoveries and RPD values.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The associated LCS and/or LCSD were within acceptance limits, therefore the data are considered valid.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
