COMMENTS:

Chevron proposes attempting a pre-frac mitigation using the Local Expansion Tool from Renegade in an attempt to shut off bradenhead pressure to below 50 psi and ultimately move forward with completions. The local expander tool uses a controlled mechanical expansion to dent the casing, densify the cement behind casing and seal off microannuli. Diagnostic logs indicate that this well is a good candidate for this technology. Our SMEs have evaluated the technology and are confident that the expansion ratio of the tool- controlled within certain specifications- will not exceed to max elongation of our casing. CVX proposes making indentions between 50' above the Niobrara and 50' below the surface casing shoe. If we still have surface casing pressure remaining after the operation, we plan to re-install a surface kit and monitor pressure build-ups periodically. This bradenhead pressure on this well is currently above the 50 psi action threshold and we have scheduled a formal bradenhead test to document high pressure. The Form 17 data will be uploaded per ECMC requirements.
