COMMENTS:

Shelton H03-635 was approved for frac on 12/08/2023 with a commitment to remediate any BH pressure >50 psi prior to POP. At the time, the 7-day build-up was 113 psi. During frac pressure built to 150 psi and the state was notified of an increasing trend. The pressure would die off instantly between stages with no LELs observed during bleed-downs and no fluid returns. Permission was given to continue fracing with the bradenhead open to a tank. Pressure did not return after frac and the well was put on production. Current pressure on the well is 30 psi and the latest Form 17 from 3/15/2024 had an initial surface casing pressure of 50 psi. This is to serve as the follow up Form 4 for phone call to ECMC for observed increasing bradenhead pressure during frac, as well as a close out for all mitigation Form 4s submitted pre-frac.
