COMMENTS:

Kerr-McGee would like to request approval to conduct a hydraulic fracturing (frac) pressure blanket on this well, which is one of (11) horizontal wells on the Blue Chip 16-22HZ well pad (location 483325). This is one of four well on the pad that will receive this treatment. Injection pressures will be less than fracture pressures. Fresh water will be injected into the Blue Chip 22-3HZ (API: 05-123-51938) at a maximum downhole gradient below 0.95 psi/ft. The planned volume of fresh water to inject is 2,500 bbls.

The temporary injection equipment will consist of quinniplex pumps, mixing tanks and storage tanks. A main treatment of surfactant-based chemicals will be injected to make good contact with the reservoir with the objective of improving oil and gas flow in the reservoir, especially after offset frac work at the nearby Vista 13-16HZ well pad (location 485057) is complete.

The surface pressure is dependent upon flow rate and friction loss in the tubulars. The surface pressure will be maintained such that frac gradient of 0.95 psi/ft is not eclipsed. Expected surface pressure are 2500-3500psi based on prior jobs. Exceeding 4200 psi is not expected at maximum injection rates. The Hazen-Williams correlation was used to estimate friction loss in the tubulars for varying rates to dictate maximum allowed surface pressure while keeping formation pressure below fracture pressure.

After injection is complete, the combined pad of three wells will be placed on production using the existing plunger lift as well as existing permanent gas lift equipment.

Estimated start date is July 6, 2024.

Please see attached procedure.
