COMMENTS:

During the Form 17 performed on 12/20/2023, we obtained a bradenhead gas sample. The sample had 69.8% nitrogen, 0.5% methane, and 27.8% hydrogen. Nitrogen is used to pull fluid from the bradenhead. Because the cement passes the well's producing zone, some residual methane is expected. A cement additive was used for this well and we suspect that is the reason for to higher levels of hydrogen. We also obtained a production gas sample. A Form 4 bradenhead mitigation plan to install a surface kit on this well was approved on 2/2/2024. The kit was installed on 4/25/2024. Flowrates were recorded, and the well flowed a total for 0 SCF over a 30-minute period. Additionally, the liquid flowrate was 0 gallons over a 30-minute period. Chevron performed a fluid pull on 2/12/2024 that had a starting surface casing pressure of 85 psi, and when the well was opened 4 gallons in 1 minute flowed for a calculated initial flow rate of 4.0 gallons/minute. During the fluid pull we collected 220 gallons of fluid from the bradenhead. We also obtained a bradenhead liquid hydrocarbon sample. The sample analysis showed hydrocarbons predominantly in the diesel organic range (C10-C28), matching the free oil phase from oil-based mud. The liquid hydrocarbon sample does not match concentrations found in the Niobrara organic range. Some residuals from oil-based mud are expected. On 6/18/2024 a Form 17 was completed with a starting pressure of 0 psi and an ending pressure 0 psi. The kit was shut in for 170 hours and 15 minutes prior to the Form 17 being performed. The surface kit will remain on location for the next 12 months and continue to be used as a mitigation strategy to maintain bradenhead pressures below the 50-psi threshold. Chevron will perform another Form 17 test on or by 6/18/2025 and a follow up Form-4 will be submitted to the ECMC.
