COMMENTS:

During the bradenhead test for this well, pressures were observed above the pressure action threshold per Rule 419. This Sundry Notice requests approval for the proposed bradenhead plan including diagnostics and mitigation. An updated WBD is attached.

The Operator intends to take the following steps to identify the source of the pressure:

Initially, the bradenhead pressure will be bled down to see if there is communication with the production casing. A diagnostic test will determine if the casing pressure is sustained. If no production casing leak is present, we will monitor the rate of pressure build on the bradenhead. Based on the recorded build rate we will reach out to ECMC to discuss the next steps. If testing indicates casing issues, we will seek approval to bring in a WO rig for remedial operations. If the casing damage looks to be such that it is not economic to repair it, the well will be put on the plugging list. All approvals for any downhole work will be secured prior to conducting any operation. Pressure gauges will be present on the casing and bradenhead to allow the operator to monitor the wellbore for any pressure changes and take immediate action if pressure builds. Locin will implement an approved remediation plan or pressure management plan and report results within 30 days or as required by the approved plan, per Rule 419.d.(2).
