Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

On May 5, 2023, a release of 6.2 barrels (bbls) from a separator occurred at the Newby 30N-34HZ facility occurred. As such, a Form 19 Initial/Supplemental Spill/Release Report (Document No. 403396708) was submitted on May 8, 2023 and the ECMC issued Spill/Release Point ID 484556. The release has been controlled and is not an active release. Assessment activities began on May 5, 2023. Groundwater was not encountered during excavation activities. Visual inspection and field screening of soil at the release location were conducted and a soil sample (SS01 @0.5') was submitted for analysis of either full list Table 915-1 constituents to establish a waste profile. Laboratory analytical results indicated that TPH, BTEX, 1,2,4- and 1,3,5-TMBs, naphthalene, benzo (a)anthracene, 1-methylnaphthalene, 2-methylnaphthalene, EC, SAR, and boron impacts exceeding the ECMC Table 915-1 allowable levels and/or site-specific background levels were present at the site.

How was extent determined?			
<p>Between May 5 and July 24, 2023, assessment activities were conducted to delineate remaining soil impacts at the release location. Confirmation soil samples were collected from the excavation at depths of 2 feet below ground surface (ft bgs), 4 ft bgs, and 6 ft bgs. The samples were submitted for analysis of the site-specific waste profile including TPH, BTEX, TMBs, PAHs, EC, SAR, boron, and select Table 915-1 metals, using ECMC approved methods. Laboratory analytical results indicated all constituent concentrations were within the ECMC Table 915-1 allowable levels or within 1.25 times background for metals at all sample locations, with the exception of barium at the SS06@2' and SS07@6' locations and selenium at the SS06@4', SS07@2',4', and SS08@2',4' locations. However, the production facility infrastructure will be replaced or remain in place at this time, and the surface area will maintain its current usage. As the remaining elevated analytes are inorganic in nature and fall below the residential soil screening levels (RSSLs), this material will be left in place pending future facility decommissioning. The elevated barium and selenium impacts will be addressed during decommissioning of the site. The PID readings and soil sample results are summarized in Table 1 and Table 2, respectively, and the laboratory reports are attached.</p>

Spill/Release Reports should be closed when impacts have been remediated or when further investigation and corrective actions will take place under an approved Form 27.

Basis for Closure: Corrective Actions Completed (documentation attached, check all that apply)

Horizontal and Vertical extents of impacts have been delineated.

Documentation of compliance with Table 915-1 is attached.

All E&P Waste has been properly treated or disposed.

Work proceeding under an approved Form 27 (Rule 912.c).

Form 27 Remediation Project No: _____

SUSPECTED Spill/Release did not occur or was below Rule 912.a.(5) reporting thresholds.

OPERATOR COMMENTS:

The production facility infrastructure will be replaced and/or remain in place at this time, and the surface area will maintain its current usage. As the remaining elevated analytes are inorganic in nature and fall below the RSSLs, this material will be left in place pending future facility decommissioning. The elevated barium and selenium impacts will be addressed during decommissioning of the site.

I hereby certify all statements made in this form are to the best of my knowledge true, correct, and complete.
