Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

Soil samples were collected during the cut and cap operation in April 2023. The excavation was backfilled to allow the field to be used for growing crops and in the fall pasturing cattle. The samples were analyzed and the TPH level at the well head exceeded the Table 915 limit. Plans to excavate further were made for the winter of 23/24 or spring 24 after the cattle were moved from the area.

Discolored/stained soils were discovered during excavating to remove soils that exceeded the TPH limit for Table 915 at the well head. The soil at the wellhead were excavated to a concrete basement floor and a sample was collected and submitted for analysis. This sample met all the limits of Table 915 with the exception of pH which may have been impacted by concrete dust generated by the excavators teeth scrapping the concrete prior to sampling.

The discolored soils are approved for disposal at the Pawnee Waste facility. Additional soil samples will be collected as necessary.
