## INITIAL ACTION SUMMARY

Description of initial action or emergency response measures take to abate, investigate, and/or remediate impacts associated with E&P Waste.

Partial decommissioning activities were completed at the Reisbeck 9-18, Watada facility on September 4, 2024. Groundwater was not encountered during excavation activities. Visual inspection and field screening of soil at one aboveground storage tank (AST) were conducted following removal activities, and a soil sample (AST01@0.5') was submitted for analysis of full list Table 915-1 constituents to determine if a release occurred. Initial laboratory analytical results indicated that lead impacts exceeding the ECMC Table 915-1 allowable level and site-specific background level was present at the AST01@0.5' location. A verification sample was collected at the AST01@0.5' location to confirm the initial result and final analytical results confirm that lead impacts are present at the AST01@0.5' location. As such, a Form 19 Initial/Supplemental Spill/Release Report (Document No. 403962075) was submitted on October 18, 2024, and the ECMC issued Spill/Release Point ID 488241. The facility soil sample locations are depicted on Figure 1. The PID readings and soil sample results are summarized in Tables 1 and 2, respectively.

Assessment activities and full facility decommissioning activities are ongoing and will be summarized in a subsequent Form 27 Supplemental report.

## PROPOSED SAMPLING PLAN

### Proposed Soil Sampling

☒ Will soil samples be collected as part of this investigation? ( Number, type (grab/composite), analyses, and locations of samples ):

On October 22, 2024, excavation activities were conducted to address remaining soil impact at the AST01@0.5' location. A confirmation soil sample was collected from the base of the excavation at approximately 1 foot below ground surface (ft bgs). The confirmation sample was submitted for laboratory analysis of the site-specific waste profile including total petroleum hydrocarbons (TPH), polycyclic aromatic hydrocarbons (PAHs), and select Table 915-1 metals, using ECMC-approved methods. Laboratory analytical results indicated that cadmium and lead concentrations above the ECMC Table 915-1 standards and background levels remain in the AST01 excavation. Assessment activities are ongoing. The laboratory reports are attached.

### Proposed Groundwater Sampling

☒ Will groundwater samples be collected as part of this investigation? ( Number, analyses, and locations of samples ):

Groundwater was not encountered during facility decommissioning activities.

### Proposed Surface Water Sampling

☐ Will surface water samples be collected as part of this investigation? ( Number, analyses, and locations of samples ):

## Additional Investigative Actions

☐ Additional alternative investigative actions described in attached Site Investigation Plan ( summary ):

On September 4, 2024, visual inspections and field screening of soil were conducted at the hatch and footprint of the AST. Based on the inspection and screening results, hydrocarbon-impacted soils were not observed at the soil screening locations. As a result, no soil samples were submitted for laboratory analysis from these areas in accordance with the ECMC Operator Guidance for Oil & Gas Facility Closure document. A photographic log is attached.

## OTHER INVESTIGATION INFORMATION

☐ Were impacts to adjacent property or offsite impacts identified?

☒ Were background samples collected as part of this site investigation?

One tank battery background soil sample (TB-BG01@0.5') was collected from the soil used to construct the tank battery for comparison to shallow samples collected within the fill material. The background soil sample was submitted for laboratory analysis of pH, electrical conductivity (EC), sodium adsorption ratio (SAR), boron, and Table 915-1 metals, using ECMC-approved methods. Laboratory analytical results indicate that arsenic and barium are naturally high in the soil used to construct the tank battery. The background soil sample laboratory analytical results are summarized in Table 2. The background soil sample location is depicted on Figure 1.

☐ Was investigation derived waste (IDW) generated as part of this investigation?

Volume of solid waste (cubic yards)

Volume of liquid waste (barrels)

☒ Is further site investigation required?

Assessment activities and full facility decommissioning activities are ongoing and will be summarized in a subsequent Form 27 Supplemental report.

## REMEDIAL ACTION PLAN

Does this Supplemental Form 27A include changes to a previously approved Remedial Action Plan? No

## SOURCE REMOVAL SUMMARY

Describe how source is to be removed.

Impacted soil will be removed and transported to a licensed disposal facility. Final disposal information will be provided upon completion of excavation activities. Disposal records will be kept on file and available upon request. The excavation areas will be backfilled and contoured to match pre-existing conditions.

## REMEDIATION SUMMARY

Describe how remediation of existing impacts to soil and groundwater is to be accomplished (i.e. summarize remedial action plan). Provide a brief narrative description including: technical justification, schedule for implementation, estimated time to attain NFA status, plus plans and specifications for the selected remedial action technology.

Laboratory data indicate that impacts exceeding the ECMC Table 915-1 allowable level and background levels for cadmium and lead are present at the AST01@0.5' location. Groundwater was not encountered in the facility excavation. Assessment activities and full facility decommissioning activities are ongoing and will be summarized in a subsequent Form 27 Supplemental report.
