## COMMENTS:

- Well: PICEANCE CREEK UNIT 197-36A8 (05-103-11187)
- Purpose: 2024 Annual BH test – PMP Update
- Form 17: (DI:403865594)
- Existing PMP: (DI: 403359710) (subDI:403671443)
- IBHP/FBHP: 305psi/87psi – Continuous gas
- IICP/FICP: 10psi/0psi – No Flow
- Threshold BH/IC: 1221psi/2779psi
- LP: ~121psi
- Failure: continuous gas on bradenhead
- Diagnostics:
  - o Integrity: Static pressures on the production and intermediate casing strings during the blow-down test confirm integrity of the production and intermediate casing.
  - o Pressure profile: During the blowdown test pressures on the bradenhead reduced quickly and the buildup following the test takes several days to return indicating a small volume/small rate. See the attached pressure chart from cygnet.
  - o Isolation: Based on a prior CBL the intermediate shows a TOC at ~3869' while surface casing is set at 4369'. Previously run CBL on the production casing string shows a TOC at ~7370' while intermediate casing is set at 9681'.
  - o Source: Based on these depths it is reasonable to assume that gas migration in the surface casing is occurring from below the shoe and channeling over time through poorly bonded cement from permeable formations such as the Wasatch (top at 3462') the Williams Fork (top at 8515'). High pressures are common in this area of the field.
  - o Sample: Gas Samples have not been taken with this annual test.
- PMP Protective of PSEHW: Collapse pressure of production string is 14540psi, the intermediate string is 6230psi and the wellhead is rated to 10,000 psi, therefore there are no current risks with pressure on the intermediate. There are no current domestic water wells within 1-mile.
- PMP/Comments: No changes to the existing PMP are proposed as the bradenhead pressure is well below the 30% threshold. Monitoring with SCADA will continue to occur to ensure that bradenhead pressure stays well below the threshold. The current WBD is attached.
