RE: January Rangely Form 14 Review

Dear Sir:

Please be advised that the following wells have problems which need to be addressed immediately:

The W.H. Coltharp B-1 passed a mechanical integrity test on February 5, 1992. On February 13, 1992 verbal notification was given to the Commission that pressure had been detected between the 7" x 13 3/8" annulus. The well has been left on the problem list pending a workover and the performance of a satisfactory mechanical integrity pressure test.

On February 13, 1992 the Fee 41 passed a mechanical integrity pressure test. It was indicated that the well had a tubing leak and had been pressure tested with a plug set in the the tubing on/off tool. A Sundry Notice should be submitted detailing the procedure to isolate the Weber Formation in addition to stating that the well is temporarily abandoned. Prior to reactivation, the well must be repaired and satisfactorily pass a mechanical integrity test. Once the Sundry Notice has been received, the pressure test performed on 2/13/92 will be approved and the well removed from the problem list.

The percentage of mechanical integrity tests witnessed by the COGCC for the period from October 1, 1991 to February 25, 1992 is approximately 35%. This figure is based on paperwork received and approved by the Commission as of this date.

If you have any questions, please feel free to contact me.

Very truly yours,

Larry Robbins  
Petroleum Engineer
