Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

The end cap on the 12" (10" ID) suction manifold malfunctioned and separated while remote frac pumping, causing produced water to be released out of the end of the line. The pump operator shut down the boost pump immediately, which limited the release of production water to the volume held within the line. The area where the frac operations are occurring contains a poly liner secondary containment, which contained all of the released fluids and allowing onsite vac trailer equipment to recover 100% of the released volume, plus additional fluids from the snow melt.

**OPERATOR COMMENTS:**

Please forward onto John Heil

On February 11, 2025 at approximately 11:00pm, TEP was conducting pumping operations at the RG 41-18-297 remote frac pad when an end cap on the 12" (10" ID) suction manifold malfunctioned and separated while pumping, allowing approximately 55 bbls of produced water to be released.

The release occurred within lined secondary containment and onsite vac trailer equipment was utilized to recover 100% of the release liquids, as well as additional fluids present at the time from snow melt.

A Supplemental Form 19 will be submitted within 10 days (no later than 2/21/25) outlining additional information pertaining to the spill, corrective actions, and any additional clean operations that may have been completed.

I hereby certify all statements made in this form are to the best of my knowledge true, correct, and complete.
