COMMENTS:

During the Form 17 performed on 7/5/2024, we obtained a bradenhead liquid hydrocarbon sample. The sample analysis showed hydrocarbons predominantly in the diesel organic range (C10-C28), matching the free oil phase from oil-based mud. The liquid hydrocarbon sample does not match concentrations found in the Niobrara organic range. Some residuals from oil-based mud are expected. A Form 4 bradenhead mitigation plan to install a surface kit on this well was approved on 7/16/2024. The kit was installed on 8/5/2024. Flowrates were recorded, and the well flowed a total for 0 SCF over a 30-minute period. Additionally, the liquid flowrate was 0 gallons over a 30-minute period. Chevron performed a fluid pull on 1/27/2025 that had a starting surface casing pressure of 53 psi and when the well was opened 3 gallons in 1 minute flowed for a calculated initial flow rate of 3.0 gallons/minute. During the fluid pull we collected 225 gallons of fluid from the bradenhead. On 1/27/2025 a Form 17 was completed with a starting pressure of 53 psi and an ending pressure 0 psi. We performed the 1/27/25 fluid pull to help alleviate surface kit runtime issues through the winter, and it was performed after the 1/27/25 Form 17. The kit was shut in for a minimum of seven days prior to the Form 17 being performed. The surface kit will remain on location for the next 12 months and continue to be used as a mitigation strategy to maintain bradenhead pressures below the 50-psi threshold. Chevron will perform another Form 17 test on or by 1/27/2026 and a follow up Form-4 will be submitted to the ECMC.
