Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

Summit Midstream (Summit) was notified on 4/14/25 at 1815 that a landowner discovered indications of a potential natural gas pipeline leak on his property. A field operator then met with the landowner to determine the exact location and investigate the release. After determining that there was an active release on the DJ-S-Mark Brown 1 lateral, the pipeline was isolated, de-pressurized and is inactive pending further investigation. The root cause of this release is still under investigation. Corrective actions are being determined and will be updated as necessary in a Supplemental Form 19.

How was extent determined?			
Initial release characterization samples were collected on April 17, 2025. The point of release (POR) was exposed via excavation and five soil samples were collected from the open excavation: one from the base at 12 feet below ground surface (ft-bgs) and one from each sidewall at six ft-bgs. Three background soil samples were collected from nearby, comparable, native soil to characterize native levels of inorganic constituents. A waste characterization sample was also collected from the excavation stockpile on site. Soil samples were submitted to an accredited laboratory for analysis of Table 915-1 soil constituents. Partial analytical results from initial sampling efforts are attached. Comprehensive analytical data will be reported in a subsequent form once data becomes available.
