COMMENTS:

This well started mitigation in December 2019. The pre-P&A bradenhead test conducted 7/8/2024 (Form 17 doc# 403848750) reported 166 psi and a total volume of 0.2422 MSCF, flown at an initial rate of 19.19 MCFD. This well was tied into the facility until P/A operations were conducted to effectively keep the bradenhead pressure below the action threshold. This can be seen in the pressure trends (charts attached). Crestone MIRU 7/29/24 and a surface plug was set due to migration being witnessed prior to cut and cap. Crestone is in contact with area engineer to discuss pressures, blowdowns and path forward. Sample results show the bradenhead gas is thermogenic, but does not match the production gas. Crestone will submit a sundry following P&A operations and a successful cut and cap to close out the Bradenhead PMP.
