COMMENTS:

TEP Rocky Mountain LLC (TEP) is reporting the results of recent diagnostic testing and requesting ECMC approval to connect the FEDERAL #RMV 59-17 bradenhead to the flowline. The diagnostic testing resulted from the bradenhead exceeding the ECMC calculated threshold pressure of 98 psi on April 8, 2026, and the Form 17 reporting the results of this test can be referenced under ECMC Document #404623246.

Per ECMC Operator Guidance, the following lines of evidence demonstrate that the FEDERAL #RMV 59-17 has both casing integrity and wellbore isolation:

- During the bradenhead test, the bradenhead pressure decreased to 0 psi within 5 minutes flowing through a two-inch valve with a de minimis volume of gas, while the production casing pressure remained unchanged.
- Monthly pressure monitoring confirms that the bradenhead pressure and production casing pressure maintain an average pressure differential of approximately 106 psi. The previous twelve months of monthly pressure monitoring data is included in the attachments.
- A review of the cement bond log for the subject well indicates cement coverage with an amplitude less than 10 mV up to at least 4,380 feet, which is approximately 1,300 feet above the top perforation located at 5,678 feet, therefore providing cement isolation of the completed interval from the production casing annulus.
- Analytical results of the production gas indicate a concentration of 1.9% Carbon Dioxide versus 0.003% Carbon Dioxide in the bradenhead gas sample. The analytical results of the recent bradenhead and production gas samples have been submitted to the ECMC via a Form 43 #404663325.

TEP is requesting ECMC approval to connect the FEDERAL #RMV 59-17 bradenhead to the flowline and satisfy the ECMC required bradenhead Pressure Management Plan for this well. The sales line pressure for the subject well has averaged approximately 50 psi for the previous year, allowing the connection to maintain bradenhead pressure below the ECMC calculated threshold pressure of 98 psi. The bradenhead connection to the flowline will effectively manage the bradenhead pressure and maintain consistent bradenhead pressure below the ECMC calculated threshold pressure of 98 psi.
